This listing of the claims replaces all prior versions in the application.

**Listing of Claims:**

1. (Currently Amended) A method of flowably dispensing dry powders from a hopper during a filling operation, the hopper having a dispensing port and a dry powder flow path, comprising:

generating a first non-linear vibration input signal, the first non-linear input signal comprising a plurality of different selected frequencies that correspond to a first dry powder formulation;

applying the first non-linear vibration input signal to a dispensing hopper having at least one dispensing port while the first dry powder formulation is flowing therethrough; and

dispensing a first meted quantity of the first dry powder through the dispensing port to a receiving member.

2. (Original) A method according to Claim 1, wherein the selected frequencies of the non-linear signal correspond to known and/or predetermined flow characteristic frequencies of the first dry powder, and wherein the generating step is carried out to cause the dry powder to flow in a substantially uniform fluidic manner without aggregation.

3. (Original) A method according to Claim 2, wherein the dispensing step is carried out by synchronizing the dispensing port to open for a predetermined amount of time, the time corresponding to the dry powder flow rate and amount of meted dry powder desired.

4. (Original) A method according to Claim 1, wherein the first meted quantity is a single unit dose amount that is less than about 15mg.

5. (Original) A method according to Claim 1, wherein the first meted quantity is a single unit dose amount that is between about 10 $\mu$ g-10mg.

6. (Original) A method according to Claim 1, wherein the dispensing step is carried out to successively dispense a plurality of meted quantities, the plurality of meted quantities being

Page 3

between about 10 $\mu$ g-10mg, and wherein each of the plurality of metered quantities are in substantially the same amount with a variation dose to dose of less than about 10%.

7. (Original) A method according to Claim 6, wherein the dose to dose variation is less than about 5%.

8. (Original) A method according to Claim 1, wherein the non-linear input signal has a plurality of superpositioned modulating frequencies.

9. (Original) A method according to Claim 1, wherein the dry powder formulation is a low-density dry powder formulation.

10. (Original) A method according to Claim 1, wherein the input signal is derived from an evaluation of observed frequencies of time between avalanches as detected in a mass flow analysis of the dry powder formulation.

11. (Original) A method according to Claim 10, wherein the derivation of the input signal converts time to frequency space to render frequency distribution data of the mass flow analysis of the dry powder formulation.

12. (Original) A method according to Claim 1, further comprising generating a second non-linear vibration input signal, the second non-linear input signal comprising a plurality of different selected signal frequencies that correspond to predetermined flow characteristics of a second dry powder formulation;

adjusting the non-linear input signal to apply a second non-linear vibration input signal to the dispensing hopper while the second dry powder formulation is flowing therethrough, the second input signal being different from the first input signal; and

dispensing a first metered quantity of the second dry powder through the dispensing port to a receiving member.

13. (Original) A method according to Claim 1, wherein the applying step is carried out at a localized portion of the hopper.

14. (Original) A method according to Claim 1, wherein the applying step is carried out by applying the non-linear vibration energy along a major portion of the length of the hopper, the length of the hopper extending in the direction of flow.

15. (Original) A method according to Claim 12, wherein the non-linear input signal comprises a plurality of superimposed frequencies that are selected to represent a desired number of the most observed frequencies in a flow analysis frequency distribution.

16. (Original) A method according to Claim 1, wherein the applying step is carried out to concurrently apply vibrational energy at multiple selected frequencies.

17. (Original) A method according to Claim 1, further comprising increasing the apparent bulk density of the first dry powder during the dispensing step without evacuating the flow path.

18. (Original) A method according to Claim 17, wherein the hopper and dispensing port define a dry powder flow path, and wherein the increasing the apparent density step comprises directing a gas at a first pressure to enter, flow across, and exit the flow path at a second lesser pressure, proximate the dispensing port as the dry powder moves downwardly in the hopper during the dispensing step.

19. (Original) A method according to Claim 1, wherein the hopper has an associated axis extending along the gas flow path, said method further comprising moving the hopper in a centrifugal motion so that it oscillates relative to the axis and generates a force with downward component or vector that is transmitted to the first dry powder formulation during the dispensing step.

20. (Original) A method according to Claim 1, wherein the hopper has an associated axis extending along the gas flow path, said method further comprising moving the hopper in an eccentric motion so that it oscillates relative to the axial center line and generates a force with downward component or vector that is transmitted to the first dry powder formulation during the dispensing step.

21. (Original) A method according to Claim 1, wherein the non-linear input signal comprises frequencies in the range of between about 10Hz to 1000kHz.

22. (Original) A method according to Claim 1, wherein the non-linear input signal comprises carrier frequencies in the range of between about 15kHz to 50kHz.

23. (Original) A method according to Claim 1, wherein the hopper comprises an insert configured to reside in the flow path in the hopper such that it downwardly extends a distance out of the dispensing port, said method further comprising translating the insert during the dispensing step to accelerate the particles of the dry powder formulation.

24. (Original) A method according to Claim 23, wherein the translating step is carried out to oscillate the insert with a selected motion that has an associated non-constant period or periods.

25. (Original) A method according to Claim 1, wherein the vibration energy input signal is based on electrical stimulation of the hopper.

26. (Original) A method according to Claim 1, wherein the vibration energy input signal is generated by mechanical stimulation of the dry powder.

27. (Original) A method according to Claim 1, wherein the vibration energy input signal is generated by electro-mechanical stimulation of the hopper and/or dry powder.

28. (Original) A method according to Claim 1, wherein the vibration energy input signal comprises imparting a high frequency motion onto a selected portion of the hopper, with the outer bounds of the motion of the hopper being small.

29. (Original) A dry powder dispensing system, comprising:  
a hopper configured to hold a dry powder therein, the hopper having at least one dispensing port and a wall with an inner surface and outer surface;  
a quantity of a dry powder disposed in the hopper;  
at least one vibration energy generation source operably associated with the hopper, wherein, in operation, the at least one vibration energy generation source is configured to output a desired non-linear vibratory energy sufficient to impart an angular velocity with downward force vectors to the dry powder as the dry powder flows downwardly to the dispensing port; and  
a control module operably associated with the hopper and the vibration energy generation source, the control module comprising:  
computer readable program code configured to direct the vibration energy source to output the vibration energy corresponding to the dry powder in the system.

30. (Original) A system according to Claim 29, the control module further comprising:  
computer readable program code configured to select the output of the vibration energy generation source from a library of non-linear energy outputs associated with a plurality of different dry powders, based on a desired predetermined dry powder specific vibration energy output associated with the dry powder being dispensed.

31. (Original) A system according to Claim 30, wherein the system is configured to dispense a plurality of different dry powders separately, and wherein the control module comprises computer readable program code that accepts user input to identify the dry powder being dispensed, and computer program code that automatically selectively adjusts the output of the vibration energy generation source based on the identified dry powder being dispensed.

32. (Original) A system according to Claim 29, wherein the computer program code for the predetermined dry powder-specific vibration energy output for the dry powder being

dispensed defines an output signal that is derived from flow data experimentally obtained from a flow analysis of the dry powder in the system.

33. (Original) A system according to Claim 30, wherein the computer program code for the library of predetermined dry powder-specific vibration energy outputs for the dry powders are derived from data obtained from a mass flow analysis of the dry powders.

34. (Original) A system according to Claim 29, wherein the dry powder is a low-density dry powder, and wherein the system is configured to serially dispense a plurality of single unit doses in amounts less than about 15mg.

35. (Original) A system according to Claim 34, wherein the single dose amount is between about 10 $\mu$ g-10mg.

36. (Original) A system according to Claim 29, wherein the system is configured to dispense a plurality of meted quantities, the plurality of meted quantities being between about 10 $\mu$ g-10mg, and wherein each of the plurality of meted quantities are in substantially the same amount with a variation, dose to dose, of less than about 10%.

37. (Original) A system according to Claim 30, wherein the computer program code of predetermined vibration generation source output signals is derived from selected parameters of a mass flow analysis of the dry powders.

38. (Original) A system according to Claim 37, wherein the derivation converts time space data of the mass flow analysis of the dry powders to frequency space data.

39. (Original) A system according to Claim 29, wherein, in operation, the vibration energy generation source is configured to deliver the output signal and cause the dry powder to flow in a substantially uniform fluidic manner without aggregation.

40. (Original) A system according to Claim 29, further comprising a valve operably associated with the at least one dispensing port and in communication with the control module, the valve being configured to open and close the flow path across the dispensing port to controllably dispense metered quantities of dry powder by permitting flow of the dry powder out of the dispensing port for a predetermined time at a substantially uniform flow rate, the flow rate and open time of the valve during the valve operation cycle corresponding to the desired dispensed dose amount.

41. (Original) A system according to Claim 29, wherein the vibration generation source is configured to output high frequency vibration energy.

42. (Original) A system according to Claim 29, wherein the hopper comprises a piezoelectric material that is operably associated with the dry powder in the hopper, and wherein the vibration energy generation source comprises a power source that can supply a selected electrical input signal to the piezoelectric material, wherein, in operation, the piezoelectric material outputs the desired vibration energy to the dry powder.

43. (Original) A system according to Claim 29, wherein the vibration generation source is configured to increase the apparent bulk density of the dry powder in the hopper during dispensing in the absence of evacuation.

44. (Original) A system according to Claim 43, further comprising:  
a permeable member attached to the hopper and positioned proximately above the dispensing port and defining a portion of the dry powder flow path; and  
a forced gas source configured to direct gas to enter a first side of the permeable member at a first pressure, flow across the gas flow path, and exit the permeable member at a different location at a second pressure to generate a pressure differential across the width of the gas flow path proximate the permeable member.

45. (Original) A system according to Claim 44, wherein the permeable member is a stainless steel filter or frit.

46. (Original) A system according to Claim 44, wherein the hopper, the permeable member, and the dispensing port define an axially extending dry powder flow path, and wherein, in operation, the apparent bulk density of the dry powder is increased as the dry powder moves downwardly in the hopper due at least in part to the transversely generated pressure differential.

47. (Original) A system according to Claim 29, wherein the hopper and associated dispensing port have an associated axis extending along the gas flow path, said system further comprising a translation mechanism that moves at least a portion of the hopper in a centrifugal motion so that the hopper and/or dispensing port oscillates relative to the axis and, in operation, generates a force with a downward component or vector that is transmitted to the first dry powder during dispensing.

48. (Original) A system according to Claim 29, wherein the hopper and dispensing port have an associated axis extending along the gas flow path, said system further comprising a translation mechanism that moves at least a portion of the hopper in an eccentric motion so that at least a portion of the hopper oscillates relative to the axis and, in operation, generates a force with a downward component or vector that is transmitted to the dry powder during dispensing.

49. (Original) A system according to Claim 29, wherein the vibration energy generation source outputs a non-linear input signal comprising vibration excitation frequencies in the range of between about 10 Hz to 1000 kHz.

50. (Original) A system according to Claim 29, wherein the vibration energy generation source outputs a non-linear input signal comprising at least one carrier frequency in the range of between about 15kHz to 50kHz and a plurality of modulation frequencies in the range of between about 10-500Hz.

51. (Original) A system according to Claim 29, further comprising an elongated insert configured to reside in the flow path in the hopper such that the insert downwardly extends a distance out of the dispensing port and eccentrically rotates relative to the axis of the flow path

Page 10

of the hopper during dispensing to transmit directional acceleration to particles of the dry powder.

52. (Original) A system according to Claim 51, wherein, in operation, the insert is oscillated with a selected motion that has an associated non-constant period.

53. (Original) A system according to Claim 29, wherein the vibration generation energy output comprises a high frequency motion applied onto a selected portion of the hopper, with the outer bounds of the motion of the hopper being small.

54. (Original) A system according to Claim 29, further comprising a computer program product controlling the dispensing of dry powders, the computer program product configured to control the activation of a valve that opens and closes the flow path of the dispensing system to control the amount of dry powder dispensed in unit dose amounts of less than about 15mg.

55-64 (Canceled).

65. (Original) A method of measuring doses of dry powder formulations, comprising:  
tensioning an elastomeric piezoelectric material with metallic conductive portions thereon;

dispensing a quantity of a dry powder onto the piezoelectric material about a predetermined location proximate at least one of the metallic conductive portions, the dispensing causing the flexing of the piezoelectric material;

measuring an alteration in a selected electrical parameter associated with the flexure of the piezoelectric material; and

determining the mass of the dispensed dry powder based on the measured alteration.

66. (Original) A method according to Claim 65, wherein the piezoelectric material is PVDF, and wherein the step of measuring is carried out by sensing the voltage generated by the piezoelectric film responsive to the weight of the dry powder positioned thereon.

Page 11

67. (Original) A method according to Claim 65, wherein the step of measuring is carried out by sensing a change in capacitance generated by the piezoelectric material due to the applied force associated with the weight of the dry powder positioned thereon.

68. (Original) A method according to Claim 65, wherein the step of measuring is carried out by sensing a change in the resonant frequency in the piezoelectric material due to the applied force associated with the weight of the dry powder positioned thereon.

69. (Original) A method according to Claim 65, wherein the dispensing is carried out for single dose amounts about 30mg or less.

70. (Original) A method according to Claim 65, wherein the dispensing is carried out for single dose amounts between about 10 $\mu$ g-10mg.

71. (Original) A method according to Claim 65, wherein the dry powder is a low density dry powder.

72. (Original) A system for measuring doses of dry powder formulations, comprising:  
means for tensioning an elastomeric piezoelectric material with metallic conductive portions thereon;

means for dispensing a quantity of a dry powder onto the piezoelectric material about a predetermined location proximate at least one of the metallic conductive portions to cause the flexing of the tensioned piezoelectric material by dispensing the dry powder thereon during the dispensing;

means for measuring an alteration in a selected electrical parameter associated with the flexure of the piezoelectric material; and

means for determining the mass of the dispensed dry powder based on the measured alteration.

73. (Original) A system of flowably dispensing dry powders from a hopper having a dispensing port and a dry powder flow path, comprising:

In re: 10/606,678

Page 12

means for generating a first non-linear vibration input signal, the first non-linear input signal comprising a plurality of different selected frequencies that correspond to a flow analysis of a first dry powder formulation;

means for applying the first non-linear vibration input signal to a dispensing hopper having at least one dispensing port while the first dry powder formulation is flowing therethrough; and

means for dispensing a first metered quantity of the first dry powder to a receiving member.

74. (New) A method according to Claim 1, wherein the first metered quantity is a single unit dose amount of a pharmaceutical dry powder.

75. (New) A dry powder filling/dispensing system, comprising:

means for holding a multi-bolus quantity of pharmaceutical dry powder having at least one dispensing port and a wall with an inner surface and outer surface;

a multi-bolus quantity of a pharmaceutical dry powder disposed in the means for holding the dry powder; and

means for generating vibration energy to output a desired non-linear vibratory input sufficient to impart an angular velocity with downward force vectors to the dry powder as the dry powder flows downwardly toward the dispensing port and is dispensed as a metered pharmaceutical dose.

76. (New) A system according to Claim 75, wherein the means for generating comprises a control module operably associated with the means for holding the dry powder, the control module comprising computer readable program code configured to controllably apply the vibration input in response to the type and/or formulation of the dry powder in the system wherein the non-linear vibration input comprises a plurality of superimposed frequencies that are selected to represent a desired number of the most observed frequencies in a flow analysis frequency distribution of the dry powder in the system.
